Water management for agriculture

- International Office for Water - Our skills -

Date de mise en ligne : Monday 23 March 2009

Description :

The significance of water for agriculture and thus for feeding the populations has not to be proven anymore, but further still, agricultural water seems one of the major factors for the development of developing economies. Relying on the French experience, IOWater is thus involved in this area of water resources management.

OIEau - IOWater - OIAgua

The significance of water for agriculture and thus for feeding the populations has not to be proven anymore, but further still, agricultural water seems one of the major factors for the development of developing economies.

Relying on the French experience, IOWater is thus involved in this area of water resources management.

Thus, the International Office for Water offers its support to developing countries to start institutional and legislative reforms giving a framework for managing water for agriculture, for making the investments needed by the water sector in agriculture and for increasing water effectiveness in the agricultural production process. IOWater's intervention can take place either on a country scale - institutional and legislative reforms, national strategy - or at the local level, on a region or basin scale.

With such a prospect in mind, IOWater helps to set up decentralized structures of general interest, comparable to the French Regional Development Companies, to carry out assignments for developing rural areas by relying on effective and integrated water management, and to define the local strategies and investments needed for targeted uses (agriculture, environment, tourism, domestic use).

In a second step, IOWater supports the development of farmers associations for irrigation and drainage purposes and, through this, participates in the building of the stakeholders' capacities for water control in agriculture (irrigators, agricultural advisers).
