

You have implemented an ecological engineering project ?

Give visibility to your project!

Ecological engineering, Nature Based Solution, Green infrastructure, solutions by and for the living ...

Whether in the mountains, in the forest, in wetlands, in an agricultural, urban, coastal or marine zone, if your project involves the living and enhances biodiversity, **we are interested...**

With the financial support of the French Agency for Biodiversity, the International Office for Water works to collect new feedbacks in Europe and internationally and to enhance them on the French platform **www.genieecologique.fr** and, if it touches fresh waters, the European platform **nwrn.eu**.

These case studies will enable French and international actors to benefit from ecological engineering experiments, from a technical point of view (design, materials, etc.) and on operational aspects (project leaders, strengths and weaknesses, difficulties encountered, etc.).

A technical description of your project will be developed using a standardized form that we will complete with your help, the form will then be used to include your project on the above dissemination platform(s).

Thank you for your cooperation!
